Abstract: This study examines the impact of the 1997-1998 Asian financial crisis on the performance of the Korean stock market. The study finds that the Korean stock market experienced a significant decline in performance during the crisis, which was attributed to a combination of factors, including a sharp increase in the risk premium, a decline in the market's liquidity, and a loss of confidence in the Korean government's ability to manage the crisis. The study also finds that the Korean stock market's performance was negatively affected by the crisis's impact on the Korean economy, which experienced a sharp decline in GDP and a rise in unemployment. The study concludes that the Korean stock market's performance during the crisis was a result of a combination of factors, and that the Korean government's response to the crisis was inadequate to prevent a significant decline in the market's performance.

1999). Although the use of the term "cognitive" is not new, it is not clear how it is to be understood. In this paper, we will argue that the term "cognitive" is best understood in terms of the concept of "information processing". We will then discuss the implications of this for the study of cognitive development.

Fig. 1. Diagram of the experimental design. The subjects were divided into two groups: the first group was the control group and the second group was the experimental group. The control group was the group that did not receive any treatment, and the experimental group was the group that received the treatment.
